Eyelashes come from nature, and we cannot change them, despite the whole development of modern cosmetology. Everything that remains those who are dissatisfied with their cilia are to try to decorate them somehow. A variety of products are used for this purpose, and the tradition of painting the eyelashes is rooted in the distant past. People do it for many thousands of years, since those times when the last mammoths were planted on Earth. Interesting facts about the eyelashes in ancient Greece and the ancient Egypt women were burned on clay plates special sticks, and then sprinkled eyelashes with this coal to make them visually more attractive. 97% of the composition of the eyelashes accounts for protein keratin, which is also present in the nails and the upper layer of the skin, the remaining 3% - water. The slope, as well as the length - the case of genetics. But if you manage to care for cilia, to feed oils and various procedures, some nuances can be corrected. Human eyelashes represent this bristly hair with a protective function: they protect their eyes from dust, dirt and insects. The duration of the life of the same hairs is about 3 months, and the full update of the eyelashes occurs in 5 months. Some antipyretic drugs significantly slow the eyelashes growth. Such actions possesses to the well-known Paracetamol. Eyelashes are growing in the wrong rows: in the upper eyelid - up to 6 rows, on the bottom - 3-4 rows. The amount of cilia in the upper eyelid is from 100 to 260, on the bottom - from 50 to 160 hairs. The baby's eyelashes are formed when he is still in the womb. This happens at about 20 weeks. Surprisingly, the baby is born without a single hairs on the body, but already with eyelashes. In 1917, the American firm Maybelline released the first mascara consisting of black coal and Vaseline, and the novelty immediately took possession of the hearts of women. The length of the eyelashes in the upper eyelid ranges in the range of 8-12 mm, on the lower - 6-8 mm. They grow continuously at a speed of 0.12-0.14 mm per day, pass all the stages of growth and fall out, like any other hair type. Specialists in physiognomy consider eyelashes an important detail that is determining our character. In an old eye, the eye in a scarce frame was considered a sign of an evil, a cunning man, whom they tried to avoid with all their forces. In the cinema, such "bald" eyes are among negative characters, or in losers. The color of the eyelashes may differ from the color of the hair. It depends on the maintenance of melanin pigment and the ratio of red, yellow, black components. The more melanin, the darker hair (see interesting facts about the hair). The embryo in the womb of mother eyelashes is beginning to grow at the 16th week of pregnancy. Length, thickness and fib, the nature of their growth is determined by genetics. At the moment, the owner of the longest eyelashes in the world that has grown naturally, this is proven, recognized Indian Phuto Rav Mauli, which lives in the province of Meal, which is located near Delhi, the capital of India. The length of his eyelashes is 4.7 centimeters. Sebaceous glands located at the base of eyelash growth, produce a special secret for lubricating hairs, protecting them from dryness and preventing fragility. In men, the eyelashes are usually longer than that of women, and the blond people are shorter than that of dark-haired people. If making eyelashes, they will grow again. Just slowly, their full update is about 5 months. Long eyelashes are considered a sign of femininity in many cultures. Although in Africa there is one tribe in which all hair is removed from the face, including eyelashes (see interesting facts about Africa).

Eyelashes are the most rude and hard hair on the human body. But even with time they lose their strength and elasticity. Like any other part of the body, they are contaminated with time. During the day, many dirt accumulates on them - cosmetics, dust and so on. So experts recommend thoroughly wash at least 2 times a day. With age, the quality of our eyelashes is also changing, as well as the condition of all tissues of the body. Eyelashes are growing throughout a person's life, but at the same time the aging processes make eyelashes thinner and less thick. Of all the living beings of the Earth, camels can boast the most thick and thick eyelashes (see interesting facts about camels). Never go to bed without removing pre-makeup with eyes. It is very harmful for eyelashes, and for skin around the eyes, the state of which can notice from this noticeably. The average length of eyelashes in the upper eyelid is 10 mm. Some mammals are absent at all. For example, many breeds of domestic cats.
