solve my homework

Modern biology has achieved impressive results at the molecular biological level. The structure of genetic material (DNA), proteins, fats, carbohydrates and their complexes has been studied. The mechanisms of transmission of hereditary information and its evolutionary variability. However, many supramolecular mechanisms for the functioning of biological organisms still remain a mystery. Such problems include the mechanisms for the formation of a phenotype from this genotype. Unclear aging mechanisms. Many problems associated with the emergence of life and its evolutionary development.
